Alphanomics: The Informational Underpinnings of Market Efficiency is intended to be a compact introduction to academic research on market efficiency, behavioral finance, and fundamental analysis and is dedicated to the kind of decision-driven and prospectively-focused research that is much needed in a market constantly seeking to become more efficient. The authors refer to this type of research as Alphanomics, the informational economics behind market efficiency. Alpha refers to the abnormal returns, which provide the incentive for some subpopulation of investors to engage in information acquisition and costly arbitrage activities. Nomics refers to the economics of alpha extraction, which encompasses the costs and incentives of informational arbitrage as a sustainable business proposition. Some of the questions that are addressed include: why do we believe

markets are efficient?; what problems have this belief engendered?; what factors can impede and/or facilitate market efficiency?; what roles do investor sentiment and costly arbitrage play in determining an equilibrium level of informational efficiency?; what is the essence of value investing?; how is it related to fundamental analysis (the study of historical financial data)?; and how might we distinguish between risk and mispricing based explanations for predictability patterns in returns? The first two sections review the evolution of academic thinking on market efficiency and introduce the noise trader model as a rational alternative. Section 3 surveys the literature on investor sentiment and its role as a source of both risks and returns. Section 4 discusses the role of fundamental analysis in value investing. Section 5 reviews the literature on limits to arbitrage, and section 6 discusses research methodology issues associated with the need to distinguish mispricing from risk.

Academics and practitioners argue that intangible values have become significant value drivers of today's economy. Major production inputs no longer comprise of property, plant and equipment, but rather of brands, knowledge and other technological innovation. Based on this notion, information on such phenomena is supposedly crucial for existing and potential capital providers in making decisions whether to allocate resources to a company. This thesis examines the information use and needs of financial analysts with respect to intangible values. The purpose is to shed light on the usefulness of such information from the perspective of one of the primary user groups of IFRSs.

[Winning in Emerging Markets](#) John Wiley & Sons

With its inception at the end of the nineteenth century as a means of consolidation and reorganization, mergers and acquisitions (M&A) have since become quasi-institutionalized as one of the primary strategic options for organizations, as they seek to secure their position in an ever more competitive and globalizing market place. Despite the optimism surrounding M&A as strategic moves, research on post-merger company performance suggests that most firms engaging in M&A activity do not achieve the sought-after performance targets, either immediately or in the years following the deal. What is it that drives M&A activity when research results do not support the performance expectations of these undertakings? Alternatively, have M&A scholars got it all wrong in the way that M&A performance is measured? Is the topic too complex, enduring, and multifaceted to study? The Handbook argues that the field of M&A is in need of a re-rooting: past research needs to be critically reviewed, and fundamental assumptions revisited. A key issue preventing efforts in the practice and study of M&A from achieving dynamic syntheses has been the disciplinary gulf separating strategy, finance, and human relations schools. The Handbook aims to bridge the hitherto separate disciplines engaged in the study and practice of M&A to provide more meaningful results. Toward this end, the Handbook brings together a set of prominent and emerging scholars and practitioners engaged in the study of M&A to provide thought-provoking, state of the art overviews of M&A through four specific 'lenses' - strategic, financial, socio-cultural, and sectorial approaches. By summarizing key findings in current research and exploring ways in which the differing approaches could and should be 'synthesized', it aims to highlight the key issues facing M&A practitioners and academics at the dawn of the third millennium.

Financial analysts provide information in their research reports and thereby help forming expectations of a firm's future business performance. Thus, it is essential to recognize analysts who provide the most precise forecasts and the accounting literature identifies characteristics that help finding the most accurate analysts. Tanja Klettke detects new relationships and identifies two new determinants of earnings forecast accuracy. These new determinants are an analyst's "general forecast effort" and the "number of supplementary forecasts". Within two comprehensive empirical investigations she proves these measures' power to explain accuracy differences. Tanja Klettke's research helps investors and researchers to identify more accurate earnings forecasts.
