 Method 1.1
 This practice
 provides a
 procedure for
 estimating
 concrete
 strength by
 means of the
 maturity
 method. The
 maturity index
 is expressed
 either in terms
 of the
 temperature-
 time factor or
 in terms of the
 equivalent

age at a specified temperature. approved by the licensed design professional and, when requested, by the building official. The Code also states that if using procedures (b), (c), and (d), sufficient data is required to demonstrate correlation of measurements on the structure with the compressive strength of molded cylinders or drilled cores. Curing Cylinders for Acceptance Testing astm c1074 - 11

Standard Practice for Estimating Concrete Strength by the Maturity Method Active Standard ASTM C1074 | Developed by Subcommittee : C09.64 ASTM-C1074, 2011 - MADCAD.com index. For example, concrete cured at a temperature of 50 °F (10°C) for 7 days may have the same maturity index as concrete cured at 80 °F (27 °C) for 3 days and therefore would have similar

strengths. ASTM C 1074 provides two types of maturity functions: The Nurse-Saul function assumes that the rate of strength CIP 39 - Maturity Methods to Estimate Concrete Strength About ASTM International. Over 12,800 ASTM Standards operate globally. Defined and set by us, they improve the lives of millions every day. Combined with our innovative

business services, they enhance performance and help everyone have confidence in the things they buy and use. Find Out More About ASTM International - Standards Worldwide ASTM C1074 provides two types of maturity functions to convert the temperature history to a maturity index: 1. The Nurse-Saul function assumes that the initial rate of strength development,

after final setting, is a linear function of temperature. The maturity index is expressed as a temperature-time factor (TTF) that is Maturity index measurement and correlation per ASTM C1074. These methods have to be approved by the licensed design professional and, when requested, by the building official. The Code also states that if using procedures

(b), (c), and (d), sufficient data is required to demonstrate correlation of measurements on the structure with the compressive strength of molded cylinders or drilled cores.
