The manipulation, in this case, refers to the addition of data to the created database and manipulation of the same. It also involves its deletion. All these tasks can be done using SQL. SQL is the most popular language used in database management systems like MySQL, SQL Server, and Oracle. This can be attributed to the fact that SQL comes with a simple syntax which anyone can grasp with much ease. Why do you need SQL? You can use SQL to create a database within your database management system. Once the database has been created, you need to create tables within the database so you can use them for storage of your data. This means that tables are the actual data storage structures in a database. The table is a combination of rows and columns that can be used for data storage. SQL comes with built-in commands you can use to insert data into the tables. Once the data has been added to the table, you can still manipulate it whenever there is a need. You can also delete the data and the
