MATHIAS MYA

Winning In The Digital

Age Springer Nature
This book constitutes the refereed proceedings of the 22nd International Conference on Concurrency Theory, CONCUR 2011, held in Aachen, Germany, September 5-10, 2011. The 32 revised full papers were carefully reviewed and selected from 94 submissions. The papers are organized in topics such as real-time systems, probabilistic systems, automata, separation logic, π -calculus, Petri nets, process algebra and modeling, verification, games, and bisimulation.

Bibliography of Agriculture Springer Science & Business Media

Quantile regression is gradually emerging as a unified statistical

methodology for estimating models of conditional quantile functions. By complementing the exclusive focus of classical least squares regression on the conditional mean, quantile regression offers a systematic strategy for examining how covariates influence the location, scale and shape of the entire response distribution. This monograph is the first comprehensive treatment of the subject, encompassing models that are linear and nonlinear, parametric and nonparametric. The author has devoted more than 25 years of research to this topic. The methods in the analysis are illustrated with a variety of applications from

economics, biology, ecology and finance. The treatment will find its core audiences in econometrics, statistics, and applied mathematics in addition to the disciplines cited above.

Gazette Du Bureau

Des Brevets Springer
An expanded and updated edition of a comprehensive presentation of the theory and practice of model checking, a technology that automates the analysis of complex systems. Model checking is a verification technology that provides an algorithmic means of determining whether an abstract model—representing, for example, a hardware or software design—satisfies a formal specification expressed as a

temporal logic formula. If the specification is not satisfied, the method identifies a counterexample execution that shows the source of the problem. Today, many major hardware and software companies use model checking in practice, for verification of VLSI circuits, communication protocols, software device drivers, real-time embedded systems, and security algorithms. This book offers a comprehensive presentation of the theory and practice of model checking, covering the foundations of the key algorithms in depth. The field of model checking has grown dramatically since the publication of the first edition in 1999, and

this second edition reflects the advances in the field. Reorganized, expanded, and updated, the new edition retains the focus on the foundations of temporal logic model while offering new chapters that cover topics that did not exist in 1999: propositional satisfiability, SAT-based model checking, counterexample-guided abstraction refinement, and software model checking. The book serves as an introduction to the field suitable for classroom use and as an essential guide for researchers.

Mathematical Foundations of Computer Science 2013 Now Publishers Inc
This handbook deals

with the question of how people can best live and work with others who come from very different cultural backgrounds. Handbook of Intercultural Training provides an overview of current trends and issues in the field of intercultural training. Contributors represent a wide range of disciplines including psychology, interpersonal communication, human resource management, international management, anthropology, social work, and education. Twenty-four chapters, all new to this edition, cover an array of topics including training for specific contexts, instrumentation and methods, and training design. Graph-Theoretic

Celfon. In Technology All investments carry with them some degree of risk. In the financial world, individuals, professional money managers, financial institutions and many others encounter and must deal with risk. The main purpose of 'Investment Risk Management' is to provide an overview of developments in risk management and a synthesis of research involving the latest developments in the field.

Environmental and Agricultural Applications Penguin Random House India Private Limited

This book constitutes the thoroughly refereed post-proceedings of the

30th International Workshop on Graph-Theoretic Concepts in Computer Science, WG 2004, held in Bad Honnef, Germany in June 2004. The 31 revised full papers presented together with 2 invited papers were carefully selected from 66 submissions during two rounds of reviewing and improvement. The papers are organized in topical sections on graph algorithms: trees; graph algorithms: recognition and decomposition; graph algorithms: various problems; optimization and approximation algorithms; parameterized complexity and exponential algorithms; counting, combinatorics, and optimization;

applications in bioinformatics and graph drawing; and graph classes and NP-hard problems.

(Re)Constructing Memory: Textbooks, Identity, Nation, and State Springer

The capability to generate potable water from polluted sources is growing in importance as pharmaceuticals, microplastics and waste permeate our soil. Nanotechnology allows for improvements in water remediation technologies by taking advantage of the unique properties of materials at this small scale.

India's New Capitalists Addison-Wesley Professional
The state-of-the-art in multimedia content analysis, media

foundations, and compression Covers digital audio, images, video, graphics, and animation Includes real-world project sets that help you build and test your expertise By two of the world's leading experts in advanced multimedia systems development The practical, example-rich guide to media coding and content processing for every multimedia developer. From DVDs to the Internet, media coding and content processing are central to the effective delivery of high-quality multimedia. In this book, two of the field's leading experts introduce today's state-of-the-art, presenting realistic examples and projects designed to help implementers create

multimedia systems with unprecedented performance. Ralf Steinmetz and Klara Nahrstedt introduce the fundamental characteristics of digital audio, images, video, graphics, and animation; demonstrate powerful new approaches to content analysis and compression; and share expert insights into system and end-user issues every advanced multimedia professional must understand. Coverage includes: Generic characteristics of multimedia and data streams, and their impact on multimedia system design
 Essential audio concepts and representation
 techniques: sound perception, psychoacoustics,

music, MIDI, Speech signals, and related I/O and transmission issues
 Graphics and image characteristics: image formats, analysis, synthesis, reconstruction, and output
 Video signals, television formats, digitization, and computer-based animation issues
 Fundamental compression methods: run-length, Huffman, and subband coding
 Multimedia compression standards: JPEG, H.232, and various MPEG techniques
 Optical storage technologies and techniques: CD-DA, CD-ROM, DVD, and beyond
 Content processing techniques: Image analysis, video processing, cut detection, and audio analysis
 First in an authoritative 3-volume

set on tomorrow's robust multimedia desktop: real-time audio, video, and streaming media. Multimedia Fundamentals offers a single, authoritative source for the knowledge and techniques you need to succeed with any advanced multimedia development project. Look for Volume 2 focusing on networking and operating system-related issues, and Volume 3 focusing on service and application issues.

The Case for Open Access to Research and Scholarship
Cambridge University Press

The rapid expansion of the field of telecommunication networks call for a new edition to assist the readers with

development of understanding towards new telecommunication technologies. This well-accepted textbook, now in its Second Edition, is designed for the final-year undergraduate and the first-year graduate students in electronics and communication engineering and allied subjects. It fulfils the need for a suitable textbook in the area of telecommunication switching systems and networks. The text covers, in a single volume, both switching systems and telecommunications networks. The book begins with a brief discussion on the evolution of telecommunication. It then goes on to give a classification scheme for switching systems,

and describes the basic components of a switching system and the fundamental concepts of network structures. It provides an in-depth coverage of fibre optic communication system and the traffic engineering concepts. A distinguishing feature of the book is the thorough treatment of the most important telecommunication networks, viz. the public switched telephone network (PSTN), the public data network (PDN), and the integrated services digital network (ISDN). Worked-out examples and exercises would be of considerable assistance to the reader in understanding all aspects of telecommunication engineering. NEW TO

THIS EDITION • Sections on SONET, WDM, and DWDM in Chapter 7 • New section on Broadband ISDN and related technologies in Chapter 11 • A new chapter on Mobile Communication which covers almost all aspects of the cell planning and mobile channels • A new chapter on Satellite Communication which gives sufficient introductory knowledge of the satellites, satellite orbits, and orbital theory • Satellite link budget analysis (with examples) in Chapter 13.
Risk Management
 Springer Nature
 The Second Edition of this critically-acclaimed text continues the standard of excellence set in the first edition

by providing a thorough introduction to the fundamentals of telecommunication networks without bogging you down in complex technical jargon or math. Although focusing on the basics, the book has been thoroughly updated with the latest advances in the field, including a new chapter on metropolitan area networks (MANs) and new sections on Mobile Fi, ZigBee and ultrawideband. You'll learn which choices are now available to an organization, how to evaluate them and how to develop strategies that achieve the best balance among cost, security and performance factors for voice, data, and image communication.

Abstracts John Wiley & Sons

Provides an overview of analysis and optimization techniques for thermally-aware chip design.

Fundamentals of Telecommunications

PHI Learning Pvt. Ltd.

A comprehensive introduction to the foundations of model checking, a fully automated technique for finding flaws in hardware and software; with extensive examples and both practical and theoretical exercises. Our growing dependence on increasingly complex computer and software systems necessitates the development of formalisms, techniques, and tools for assessing functional properties of these

systems. One such technique that has emerged in the last twenty years is model checking, which systematically (and automatically) checks whether a model of a given system satisfies a desired property such as deadlock freedom, invariants, and request-response properties. This automated technique for verification and debugging has developed into a mature and widely used approach with many applications. Principles of Model Checking offers a comprehensive introduction to model checking that is not only a text suitable for classroom use but also a valuable reference for researchers and practitioners in the field. The book begins

with the basic principles for modeling concurrent and communicating systems, introduces different classes of properties (including safety and liveness), presents the notion of fairness, and provides automata-based algorithms for these properties. It introduces the temporal logics LTL and CTL, compares them, and covers algorithms for verifying these logics, discussing real-time systems as well as systems subject to random phenomena. Separate chapters treat such efficiency-improving techniques as abstraction and symbolic manipulation. The book includes an extensive set of examples (most of which run through several chapters) and a

complete set of basic results accompanied by detailed proofs. Each chapter concludes with a summary, bibliographic notes, and an extensive list of exercises of both practical and theoretical nature.

Physical sciences

Springer

The book covers some most recent studies and updated issues in the following areas: 1. Finance: The articles in this chapter discuss contemporary issues in finance, given the rise of regional economic integration and digitalisation. Some of the topics covered include (among others) the nexus among internalisation, capital investment, and firm performance in several ASEAN countries; and operational risk

management process in a peer-to-peer lending company in agricultural sector. 2. Marketing: It is interesting to examine marketing dynamics in the global and digital era. Therefore, several articles in this chapter aim to investigate consumers' behaviour in mobile payment acceptance and online marketplace. This book is strongly recommended to be used as a reference for researchers, students, and also business practitioners not only in Indonesia, but also wider audiences that required deeper insights/thoughts in dynamic, changing and global emerging market (ie: in Indonesia).

Facilitating

Cooperation for Wireless Systems

Cooperative

Communications:

Hardware, Channel & PHY focuses on issues pertaining to the PHY layer of wireless communication

networks, offering a rigorous taxonomy of this dispersed field, along with a range of application scenarios for cooperative and distributed schemes,

demonstrating how these techniques can be employed. The authors discuss hardware, complexity and power consumption issues, which are vital for understanding what can be realized at the PHY layer, showing how wireless channel models differ from more traditional models, and highlighting the reliance of PHY algorithm performance on the underlying channel models.

Numerous transparent and regenerative relaying protocols are described in detail for a variety of transparent and regenerative cooperative schemes.

Key Features:

Introduces background, concepts, applications, milestones and thorough taxonomy

Identifies the potential in this emerging technology applied to e.g. LTE/WiMAX, WSN
 Discusses latest wireless channel models for transparent and regenerative protocols
 Addresses the fundamentals as well as latest emerging PHY protocols
 Introduces transparent distributed STBC, STTC, multiplexing and beamforming protocols
 Quantifies regenerative distributed space-time, channel and network coding protocols
 Explores system optimization, such as distributed power allocation and relay selection
 Introduces and compares analog and digital hardware architectures
 Quantifies complexity, memory and power consumption of 3G UMTS & 4G LTE/WiMAX

relay Highlights future research challenges within the cooperative communications field
 This book is an invaluable guide for professionals and researchers in communications fields.
 It will also be of interest to graduates of communications and electronic engineering courses.
 It forms part of an entire series dedicated to cooperative wireless systems.

This book constitutes the thoroughly refereed conference proceedings of the 38th International Symposium on Mathematical Foundations of Computer Science,

MFCS 2013, held in Klosterneuburg, Austria, in August 2013. The 67 revised full papers presented together with six invited talks were carefully selected from 191 submissions. Topics covered include algorithmic game theory, algorithmic learning theory, algorithms and data structures, automata, formal languages, bioinformatics, complexity, computational geometry, computer-assisted reasoning,

concurrency theory, databases and knowledge-based systems, foundations of computing, logic in computer science, models of computation, semantics and verification of programs, and theoretical issues in artificial intelligence.
