A User's Guide to  
Thought and Meaning  
presents a profound  
and arresting  
integration of the  
faculties of the mind -

of how we think, speak, and see the world. Ray Jackendoff starts out by looking at languages and what the meanings of words and sentences actually do. He shows that meanings are more adaptive and complicated than they're commonly given credit for, and he is led to some basic questions: How do we perceive and act in the world? How do we talk about it? And how can the collection of neurons in the brain give rise to conscious experience? As it turns out, the organization of language, thought, and perception does not look much like the way we experience things, and only a small part of what the brain does is conscious. Jackendoff concludes that thought and meaning must be

almost completely unconscious. What we experience as rational conscious thought - which we prize as setting us apart from the animals - in fact rides on a foundation of unconscious intuition. Rationality amounts to intuition enhanced by language. Written with an informality that belies both the originality of its insights and the radical nature of its conclusions, *A User's Guide to Thought and Meaning* is the author's most important book since the groundbreaking *Foundations of Language* in 2002. Mind Is Flat Addison-Wesley Professional

In a radical reinterpretation of how the mind works, an eminent behavioral scientist reveals the illusion of mental depth. Psychologists and neuroscientists struggle with how best to interpret human motivation and decision making. The assumption is that below a mental "surface" of conscious awareness lies a deep and complex set of inner beliefs, values, and desires that govern our thoughts, ideas, and actions, and that to know this depth is to know ourselves. In this profoundly original book, behavioral scientist Nick Chater contends just the opposite: rather than being the plaything of unconscious currents,

the brain generates behaviors in the moment based entirely on our past experiences. Engaging the reader with eye-opening experiments and visual examples, the author first demolishes our intuitive sense of how our mind works, then argues for a positive interpretation of the brain as a ceaseless and creative improviser.

**Life 3.0** John Wiley & Sons

The unconscious has had a long and chequered history. For at least the last 4,000 years, societies have concocted comforting fables in the face of the recurrent puzzles of human existence - death, dreaming, madness, possession, inspiration - that invariably rely on some

notion of the unconscious. Supernatural 'fairy stories' need some internal proxy or contact point through which the influence of demons and spirits can flow. And without such gods and forces, some psychological machinery is needed to take over their work. But what IS the unconscious? Is it 'God's viceroy', the soul? Is it the locked ward of Freudian desire? Is the subliminal mind the source of the sublime emotions of the Romantics? Is it the mental microchip of cognitive science? Or is it simply the brain? *Human* Andrews UK Limited  
What happened along the evolutionary trail that made humans so unique? In his

accessible style, Michael Gazzaniga pinpoints the change that made us thinking, sentient humans different from our predecessors. He explores what makes human brains special, the importance of language and art in defining the human condition, the nature of human consciousness, and even artificial intelligence. New York Times Best Seller How will Artificial Intelligence affect crime, war, justice, jobs, society and our very sense of being human? The rise of AI has the potential to transform our future more than any other technology—and there's nobody better qualified or situated to

explore that future than Max Tegmark, an MIT professor who's helped mainstream research on how to keep AI beneficial. How can we grow our prosperity through automation without leaving people lacking income or purpose? What career advice should we give today's kids? How can we make future AI systems more robust, so that they do what we want without crashing, malfunctioning or getting hacked? Should we fear an arms race in lethal autonomous weapons? Will machines eventually outsmart us at all tasks, replacing humans on the job market and perhaps altogether? Will AI help life flourish like never before or give us more

power than we can handle? What sort of future do you want? This book empowers you to join what may be the most important conversation of our time. "The Knowledge Illusion is filled with insights on how we should deal with our individual ignorance and collective wisdom." —Steven Pinker

We all think we know more than we actually do. Humans have built hugely complex societies and technologies, but most of us don't even know how a pen or a toilet works. How have we achieved so much despite understanding so little? Cognitive scientists Steven Sloman and Philip Fernbach argue that we survive and thrive despite our mental shortcomings because

we live in a rich community of knowledge. The key to our intelligence lies in the people and things around us. We're constantly drawing on information and expertise stored outside our heads: in our bodies, our environment, our possessions, and the community with which we interact—and usually we don't even realize we're doing it. The human mind is both brilliant and pathetic. We have mastered fire, created democratic institutions, stood on the moon, and sequenced our genome. And yet each of us is error prone, sometimes irrational, and often ignorant. The fundamentally communal nature of intelligence and knowledge explains

why we often assume we know more than we really do, why political opinions and false beliefs are so hard to change, and why individual-oriented approaches to education and management frequently fail. But our collaborative minds also enable us to do amazing things. The Knowledge Illusion contends that true genius can be found in the ways we create intelligence using the community around us. *The Hawaiian Forgiveness Ritual as the Key to Your Life's Fulfillment* MIT Press Biocentrism shocked the world with a radical rethinking of the nature of reality. But that was just the beginning. In *Beyond Biocentrism*, acclaimed biologist Robert Lanza,

one of TIME Magazine's "100 Most Influential People in 2014," and leading astronomer Bob Berman, take the reader on an intellectual thrill-ride as they re-examine everything we thought we knew about life, death, the universe, and the nature of reality itself. The first step is acknowledging that our existing model of reality is looking increasingly creaky in the face of recent scientific discoveries. Science tells us with some precision that the universe is 26.8 percent dark matter, 68.3 percent dark energy, and only 4.9 percent ordinary matter, but must confess that it doesn't really know what dark matter is and knows even less about dark energy. Science is

increasingly pointing toward an infinite universe but has no ability to explain what that really means. Concepts such as time, space, and even causality are increasingly being demonstrated as meaningless. All of science is based on information passing through our consciousness but science hasn't the foggiest idea what consciousness is, and it can't explain the linkage between subatomic states and observation by conscious observers. Science describes life as a random occurrence in a dead universe but has no real understanding of how life began or why the universe appears to be exquisitely designed for the

emergence of life. The biocentrism theory isn't a rejection of science. Quite the opposite. Biocentrism challenges us to fully accept the implications of the latest scientific findings in fields ranging from plant biology and cosmology to quantum entanglement and consciousness. By listening to what the science is telling us, it becomes increasingly clear that life and consciousness are fundamental to any true understanding of the universe. This forces a fundamental rethinking of everything we thought we knew about life, death, and our place in the universe.

"Know thyself," a precept as old as Socrates, is still good advice. But is introspection the best path to self-knowledge? Wilson makes the case for

better ways of discovering our unconscious selves. If you want to know who you are or what you feel or what you're like, Wilson advises, pay attention to what you actually do and what other people think about you. *The Case Against**Reality: Why Evolution**Hid the Truth from Our Eyes* Penguin

This open access book chronicles the rise of a new scientific paradigm offering novel insights into the age-old enigmas of existence. Over 300 years ago, the human mind discovered the machine code of reality: mathematics. By utilizing abstract

thought systems, humans began to decode the workings of the cosmos. From this understanding, the current scientific paradigm emerged, ultimately discovering the gift of technology. Today, however, our island of knowledge is surrounded by ever longer shores of ignorance. Science appears to have hit a dead end when confronted with the nature of reality and consciousness. In this fascinating and accessible volume, James Glattfelder explores a radical paradigm shift uncovering the ontology of reality. It is found to be information-theoretic and participatory, yielding a computational and programmable

universe.

If you're good at  
finding the one right  
answer to life's  
multiple-choice  
questions, you're  
"smart." But  
"intelligence" is what  
you need when  
contemplating the  
leftovers in the  
refrigerator, trying to  
figure out what might

go with them; or if you're trying to speak a sentence that you've never spoken before. As Jean Piaget said, intelligence is what you use when you don't know what to do, when all the standard answers are inadequate. This book tries to fathom how our inner life evolves from one topic to another, as we create and reject alternatives. Ever since Darwin, we've known that elegant things can emerge (indeed, self-organize) from "simpler" beginnings. And, says theoretical neurophysiologist William H. Calvin, the bootstrapping of new ideas works much like the immune response or the evolution of a

new animal species—except that the brain can turn the Darwinian crank a lot faster, on the time scale of thought and action. Drawing on anthropology, evolutionary biology, linguistics, and the neurosciences, Calvin also considers how a more intelligent brain developed using slow biological improvements over the last few million years. Long ago, evolving jack-of-all trades versatility was encouraged by abrupt climate changes. Now, evolving intelligence uses a nonbiological track: augmenting human intelligence and building intelligent machines.
