Abstract: We address the image denoising problem, where zero-mean white and homogeneous Gaussian additive noise is to be removed from a given image. The approach taken is based on sparse and redundant representations over trained dictionaries. Image Denoising Via Sparse and Redundant Representations ...Sparse decomposition Noiseless observations. Consider a linear system of equations $\mathbf{y} = \mathbf{D}\mathbf{x}$, where \mathbf{y} is an underdetermined $n \times m$ matrix ($n < m$) and $\mathbf{x} \in \mathbb{R}^m$. The matrix (typically assumed to be full-rank) is referred to as the dictionary, and \mathbf{x} is a signal of interest. The core sparse representation problem is defined as the quest for the sparsest possible representation satisfying $\mathbf{y} = \mathbf{D}\mathbf{x}$.
