Cooperative Effects in Optics, Superradiance and Phase ... For want of a better term, a gas which is radiating strongly because of coherence will be called 'superradiant'. In quantum optics, superradiance is a phenomenon that occurs when a group of N emitters, such as excited atoms, interact with a common light field. If the

wavelength of the light is much greater than the separation of the emitters, then the emitters interact with the light in a collective and coherent fashion. Superradiance has been extensively studied in the 1970s and 1980s in the regime of superfluorescence, where a large number of atoms are initially excited. Cooperative scattering in the linear-optics regime, or "single-photon superradiance," has been investigated much more recently, and superradiant decay has also been predicted, even for a spherical sample of large extent and low density, where the distance between atoms is much larger than the wavelength. Superradiance in a large and dilute cloud of cold atoms in ... Cooperative scattering has been the subject of

intense research in the last years. In this article, we discuss the concept of cooperative scattering from a broad perspective. We briefly review the various collective effects that occur when light interacts with an ensemble of atoms. We show that some effects that have been recently discussed in the context of 'single-photon superradiance', or cooperative scattering in the linear-optics regime, can also be explained by 'standard optics ... Cooperative Effects in Optics | BiggerBooks Recent experiments by Rainò et al. (Nature 2018, 563, 671–675) have documented cooperative emission from CsPbBr₃

nanocrystal superlattices, exhibiting the hallmarks of low-temperature superradiance. In particular, the optical response is coherent and the radiative decay rate is increased by a factor of 3, relative to that of individual nanocrystals.
