The Comprehensive Clinician's Guide to Cognitive Behavioral Therapy Guilford Publications
Cognitive behavior therapy is now firmly established as the leading psychological treatment for many psychiatric conditions, and numerous controlled trials have demonstrated its effectiveness. This innovative book provides detailed guidance on how to practice cognitive behavior therapy with patients suffering from a wide range of emotional disorders. Unlike most existing handbooks this guide concentrates on how to do treatment. The editors have drawn together contributions from acknowledged experts in the practice, teaching, and empirical investigation of cognitive-behavioral principles, followed by a detailed account of how to carry out a cognitive-behavioral assessment. Subsequent chapters provide self-contained descriptions of how to use cognitive behavior therapy to treat particular conditions, including panic and generalized anxiety, phobic disorders, depression, obsessional disorders, somatic problems, eating disorders, chronic psychiatric handicaps, marital problems, and sexual dysfunctions. A final chapter describes problem solving. Each chapter begins with a description of the condition under consideration, outlines assessment procedures and how to formulate the problem, and then takes the reader step-by-step through treatment, emphasizing how to overcome difficulties encountered during treatment. Extensive use is made of clinical material and case illustrations.

Trauma Harper Collins

Behavioural experiments are one of the central and most powerful methods of intervention in cognitive therapy. Yet until now, there has been no volume specifically dedicated to guiding physicians who wish to design and implement behavioural experiments across a wide range of clinical problems. The *Oxford Guide to Behavioural Experiments in Cognitive Therapy* fills this gap. It is written by clinicians for clinicians. It is a practical, easy to read handbook, which is relevant for practising clinicians at every level, from trainees to cognitive therapy supervisors. Following a foreword by David Clark, the first two chapters provide a theoretical and practical background for the understanding and development of behavioural experiments. Thereafter, the remaining chapters of the book focus on particular problem areas. These include problems which have been the traditional focus of cognitive therapy (e.g. depression, anxiety disorders), as well as those which have only more recently become a subject of study (bipolar disorder, psychotic symptoms), and some which are still in their relative infancy (physical health problems, brain injury). The book also includes several chapters on transdiagnostic problems, such as avoidance of affect, low self-esteem, interpersonal issues, and self-injurious behaviour. A final chapter by Christine Padesky provides some signposts for future development. Containing examples of over 200 behavioural experiments,

this book will be of enormous practical value for all those involved in cognitive behavioural therapy, as well as stimulating exploration and creativity in both its readers and their patients.
