Davis's Drug Guide for Nurses John Wiley & Sons

Pharmacology in Nursing focuses on the use of medications within the healthcare environment in Australia and New Zealand. Taking a body systems approach, this text is written specifically for nursing students and highlights the need for nurses to understand the science behind medications alongside clinical requirements for medication administration, safety, patient/client education and dosage calculation. Medication tables provide an overview of important medication information, including indications, active ingredients and nursing considerations. 'Practical and professional application' boxes ensure that the theory is shown in context, and the text layout is appealing to the reader. Emphasis is placed on clinical reasoning, critical thinking, and evidence-based research.

**Drug Benefits and Risks** Lippincott Williams & Wilkins

Now in its fourth edition, this best-selling book is fully updated to address the ever increasing demands on healthcare professionals to deliver high-quality patient care. A multitude of factors impinge on healthcare delivery today, including an ageing population, more sophisticated

medicines, high patient expectation and changing health service infrastructure. Time demands on primary care doctors have caused other models of service delivery to be adopted across the world, leading to ongoing changes in the traditional boundaries of care between doctors, nurses, and pharmacists. Certain medical tasks are now being performed by nurses and pharmacists, for example prescribing. Healthcare policies to encourage patients to manage their own health have led to more medicines becoming available over the counter, allowing community pharmacists to manage and treat a wide range of conditions. Further deregulation of medicines to treat acute illness from different therapeutic areas seems likely. Government policy now encourages chronic disease management as a self-care activity, and could well be the largest area for future growth of reclassification of medicines. Pharmacists, now more than ever before, need to be able to recognise the signs and symptoms, and use an evidence-based approach to treatment. Community Pharmacy is intended for all non-medical prescribers but especially for pharmacists, from undergraduate students to experienced practitioners. Key features - Guidance for arriving at a differential diagnosis - Practical prescribing tips - Trigger points for referral boxes - Other hints and

tips boxes - Specific questions to ask boxes - Case studies - Self-assessment questions Consistent approach gives: - Anatomy overview - History taking and physical examination - Prevalence and epidemiology - Aetiology - Arriving at a differential diagnosis - Clinical features - Conditions to eliminate Likely causes Unlikely causes Very unlikely causes - Evidence base for OTC medicine - Practical prescribing and product selection - More on the examination of eyes, ears and mouth - New sections on future-proofing (vaccinations etc.) - New material covering inter-professional education for clinical skills. The Australian Guidelines for the Treatment of Alcohol Problems have been periodically developed over the past 25 years. In 1993, the first version of these guidelines, titled: 'An outline for the management of alcohol problems: Quality assurance in the treatment of drug dependence project' was published (Mattick & Jarvis 1993). The Australian Government commissioned an update a decade later (Shand et al. 2003) and a further edition in 2009 to integrate the Guidelines with the Australian Guidelines to Reduce Health Risks from Drinking Alcohol (National Health and Medical Research Council, NHMRC 2009; Haber et al., 2009). The present version of the Guidelines was also commissioned by the Commonwealth of Australia to remain current and integrated with the updated NHMRC consumption guidelines (2020). In order to ensure that guidelines remain relevant, the next set of guidelines should be updated in 2025, consistent with NHMRC recommendation that guidelines be updated every five years. These guidelines aim to provide up-to-date, evidence-based information to clinicians on available treatments for people with alcohol problems and are largely directed towards individual clinicians in practice, such as primary care physicians (general practitioners, nursing staff), specialist medical practitioners, psychologists and other counsellors, and other health professionals. Some chapters highlight service or system level issues that impact on clinicians and their patients. These include recommendations concerning Aboriginal and Torres Strait Islander peoples, culturally and linguistically diverse groups, stigma, and discrimination. Elsewhere, organisation capacity is implied, such as medical resources for withdrawal management where recommendations indicate use of medications. As all forms of treatment will not be readily available or suitable for all populations or settings, these guidelines may require interpretation and adaptation.

Every year we see a remarkable increase in scientific knowledge. We are learning more each day about the world around us, about the numerous biological organisms of the biosphere, about the physical and chemical processes that shaped and continue to change our planet. The cataloging, retrieval, dissemination, and use of this new information along with the continued development of new computer technology provide some of the most challenging problems in science as we enter the Information Age. With the explosion of knowledge in science, it is especially important that students in introductory courses learn not only the basic material of a subject, but also about the newest developments in that subject. With this goal in mind, we have prepared a second edition of *Introduction to Plant Diseases: Identification and Management*. We prepared this edition with the same general purpose that we had for the first edition - to provide practical, up-to-date information

that helps in the successful management of diseases on food, fiber, and landscape plants for students who do not have a strong background in the biological sciences. We included new information on (1) the precise identification of diseases and the pathogens that cause them, (2) the development of epidemics of plant diseases, (3) the application of biotechnology in plant pathology, (4) the use of alternative methods of crop production and disease management that help protect the environment, and (5) diseases that have become more important since the first edition was published.
