The network analyzer lends itself very nicely to obtaining 50 ohms matches. However, for high impedance matches the Smith chart data will be far to the right of the chart and will be inaccurate, hard to read, and hard to interpret. If the network analyzer were normalized to the impedance value to which you want to match, the data would be in the center of the Smith chart and easy to interpret. Method of Achieving High Impedance Matching with a Network Shunt inductance impedance matching is often employed in HF mobile antenna installations when the radiating element is less than a quarter-wavelength in height and an impedance step-up to match a 50 ohm transmission line is desired.
