 Organic Polymer Chemistry. • Thermoplastic: a polymer that can be melted and molded into a shape that is retained when it is cooled • Thermoset plastic: a polymer that can be molded when it is first prepared but, once it is cooled, (sometime called "curing") hardens irreversibly and cannot be remelted.

 Introduction to Polymers
 Polymers are substances containing a large number of structural units joined by the same type of linkage. These substances often form into a chain-like structure.
 Polymers - Chemistry LibreTexts
 Polymer chemistry is an example of applied organic chemistry. Polymers are long chain macromolecules built from repeated smaller chemical structures or 'mers.' They are found widely in the natural world (e.g. proteins, rubber, cellulose) and, increasingly the past century, in synthetic form (e.g. "plastics").
 28. Polymers: Structure & Composition | Organic Materials ...
 The seven most common types of synthetic organic polymers are: low density polyethylene (LDPE), high density polyethylene (HDPE), polypropylene (PP), polyvinyl chloride (PVC), polystyrene (PS), nylon, Teflon, and thermoplastic polyurethane (TPU).
