An illustrated guide for the complex process of orthodontic diagnostics and indication. The total process of treatment planning including the scientific bases is pictorially described. Beside the conventional methods of examination and model analysis, emphasis is placed on the cranio-facial

growth processes, the aetiology of malocclusions and on the importance of functional analysis. The following three aspects are described in detail in this book: Growth of the Facial Skeleton - types of treatment which promote or guide growth. In order to control these natural processes artificially, a precise understanding of them is required. Aetiology of the Malocclusion - the various types of causative therapy and the elimination of the causes. Functional Analysis - many malocclusions are a result of dysfunctions. As a variety of methods are available for treating dysfunctions, functional analysis is taken very seriously.

Failure of eruption of permanent teeth (tooth impaction) represents a common, but as yet largely unexplored, problem with regard to proper treatment and prevention. This condition affects almost 20% of the population. Thus, the third molar impaction problem alone represents the second most expensive medico-dental surgical problem in the United States. Apart from that, the sequelae of surgical removal of third molars (that is, dental nerve damage) are the most frequent complaints in dental litigation in the United States. This book includes manifold aspects of tooth impactions such as etiology, diagnosis, treatment and prevention of all types of tooth impactions. The treatment aspect is illustrated by step-by-step color illustrations of all aspects of the surgical procedure.
