**Fundamentals of Heat and Mass Transfer** McGraw-Hill Science/Engineering/Math  
 Differential Equations for Engineers and Scientists is intended to be used in a first course on differential equations taken by science and engineering students. It covers the standard topics on differential equations with a wealth of applications drawn from engineering and science--with more engineering-specific examples than any other similar text. The text is the outcome of the lecture notes developed by the authors over the years in teaching differential equations to engineering students.

**Fundamentals of Thermal-fluid Sciences** McGraw Hill Professional  
 This broad-based book covers the three major areas of Chemical Engineering. Most of the books in the market involve one of the individual areas, namely, Fluid Mechanics, Heat Transfer or Mass Transfer, rather than all the three. This book presents this material in a single source. This avoids the user having to refer to a number of books to obtain information. Most published books covering all the three areas in a single source emphasize theory rather than practical issues. This book is written with emphasis on practice with brief theoretical concepts in the form of questions and answers, not adopting stereo-typed question-answer approach practiced in certain books in the market, bridging the two areas of theory and practice with respect to the core areas of chemical engineering. Most parts of the book are easily understandable by those who are not experts in the field. Fluid Mechanics chapters include basics on non-Newtonian systems which, for instance find importance in polymer and food processing, flow through piping, flow measurement, pumps, mixing technology and fluidization and two phase flow. For example it covers types of pumps and valves, membranes and areas of their use, different equipment commonly used in chemical industry and their merits and drawbacks. Heat Transfer chapters cover the basics involved in conduction, convection and radiation, with emphasis on insulation, heat exchangers, evaporators, condensers, reboilers and fired heaters. Design methods, performance, operational issues and maintenance problems are highlighted. Topics such as heat pipes, heat pumps, heat tracing, steam traps, refrigeration, cooling of electronic devices, NOx control find place in the book. Mass transfer chapters cover basics such as diffusion, theories, analogies, mass transfer coefficients and mass transfer with chemical reaction, equipment such as tray and packed columns, column internals including structural packings, design, operational and installation issues, drums and separators are discussed in good detail. Absorption, distillation, extraction and leaching with applications and design methods, including emerging practices involving Divided Wall and Petluk column arrangements, multicomponent separations, supercritical solvent extraction find place in the book.

"This collection provides a powerful and sophisticated analysis of how environmental movements influence politics in Asia, and how politics influences movements." -- John S. Dryzek, Centenary Professor, University of Canberra "This important book reflects the challenges and questions currently foremost in scholars', activists' and policy-makers' minds-the Anthropocene, environmental justice, China's Belt and Road Initiative, and post-politics-all addressed through the lens of environmental movements in Asia. -- Jonathan Rigg, Professor at the School of Geographical Sciences, University of Bristol "How have authoritarianism, democratization and political change affected environmentalism in East and Southeast Asia? How have environmental mobilization and demands for environmental justice at the grassroots influenced politics there? These are among the vital questions answered by this insightful and well-crafted volume." --Paul G. Harris, Chair Professor of Global and Environmental Studies, Education University of Hong Kong "This book shows convincingly that the concept of Anthropocene is as relevant in Asia as anywhere." -- Philip Hirsch, Emeritus Professor of Human Geography, University of Sydney "Despite its claims to universality, the Anthropocene concept remains largely a Western phenomenon. Heat Transfer Tools with CD-ROM is the first resource to effectively link project-based learning to introductory Heat Transfer courses. This effective software package offers multiple projects developed to provide students with a new dimension in exploring design and working with open-ended problems. The CD-ROM, included with the text, offers assorted project work in a combination of spreadsheet formats, Visual Basic executables, Windows help files and Fortran .dll files. The interface is intuitive, providing graphics and boxes for inputting math information for each project, and leading students to a better understanding of major equations. Features:· Students gain experience using the computer to explore designs and solve open-ended problems.· The CD-ROM does not require any advanced systems resources -- it will work on any Windows machine with basic memory resources (64K) and a graphics card· Modern, research-based numerical algorithms function behind the scenes in most of the nine "canned" modules. Thorough write-ups of most of these algorithms are included as "pdf" files on the CD-ROM.· Modern custom user interfaces coupled with extensive use of graphical displays allow users to test parameters and to visualize and understand the underlying physics. This software was created solely for instruction use! The modules are NOT stripped-down versions of a professional Computational Fluid Dynamics (CFD) package. With no extraneous inputs and outputs, these modules have virtually no learning curve. "Learning the software" is learning the heat transfer!· In addition to the nine Visual Basic/Fortran modules, six projects intended for implementation by students are provided.· A separate appendix on the CD-ROM teaches students everything they need to know about Visual Basic for Applications (VBA), the extremely powerful and flexible programming language incorporated into Excel.· Instructors can use these modules as lecture aids in a classroom equipped with a projection system or as the nucleus of a "hands-on" approach to heat transfer instruction in a computer classroom.· All the "canned" modules can be verified for at least some parameters by comparison with traditional analytical solutions or experimental data. Verification of results is stressed throughout.· Introduces students to Computational Fluid Dynamics (CFD) by application to simple, fundamental problems. In contrast many practicing engineers are introduced to CFD only through two- or three-day short courses provided by vendors.· Several of these modules have been under development for up to 15 years. Nearly all Visual Basic modules have been classroom-tested at the undergraduate level five times and at the graduate level twice. They have been debugged and enhanced extensively during that time.
