It also celebrates the EOQ model's 100th anniversary. The handbook contains papers which explore both the deterministic and the stochastic EOQ model-based problems and applications. It is organized into three parts: Part I presents the introduction and review papers. Part II includes technical analyses on single-echelon EOQ model-based inventory problems.

(International Series in Operations Research & Management ...

Calculate the EOQ In this problem: $D = \text{annual demand} = (2 \text{ tires per bicycle}) \times (450 \text{ bicycles per month}) \times (12 \text{ months in a year}) = 10,800 \text{ tires}$
 $S = \text{ordering cost} = \50 per order
 $H = \text{carrying cost} = (15\%) \times (\$20 \text{ per unit}) = \$3.00 \text{ per unit per year}$
 $EOQ = \text{Square root of } \{ (2 \times 10,800 \times \$50) / \$3 = \text{Square root of } 400,000 = 600 \text{ tires}$
 The company should order about 600 tires each time it places an order.
