Glencoe Advanced Mathematical Concepts

McGraw-Hill/Glencoe

This text is intended

for the Foundations of

Higher Math bridge course taken by

prospective math majors following

completion of the mainstream Calculus

sequence, and is designed to help

students develop the abstract mathematical

thinking skills necessary for success

in later upper-level majors math courses.

As lower-level courses

such as Calculus rely more exclusively on

computational

problems to service

students in the

sciences and

engineering, math

majors increasingly

need clearer guidance

and more rigorous

practice in proof

technique to

adequately prepare

themselves for the

advanced math

curriculum. With their

friendly writing style

Bob Dumas and John

McCarthy teach

students how to

organize and structure

their mathematical

thoughts, how to read

and manipulate

abstract definitions,

and how to prove or

refute proofs by

effectively evaluating

them. Its wealth of

exercises give students

the practice they need,

and its rich array of topics give instructors the flexibility they desire to cater coverage to the needs of their school's majors curriculum. This text is part of the Walter Rudin Student Series in Advanced Mathematics. *Mathematics, Course 1* McGraw-Hill Education Student edition Mathematical Connections McGraw-Hill Education A Bridge to Higher Mathematics is more than simply another book to aid the transition to advanced mathematics. The authors intend to assist students in developing a deeper understanding of mathematics and mathematical thought. The only way to understand mathematics is by

doing mathematics. The reader will learn the language of axioms and theorems and will write convincing and cogent proofs using quantifiers. Students will solve many puzzles and encounter some mysteries and challenging problems. The emphasis is on proof. To progress towards mathematical maturity, it is necessary to be trained in two aspects: the ability to read and understand a proof and the ability to write a proof. The journey begins with elements of logic and techniques of proof, then with elementary set theory, relations and functions. Peano axioms for positive integers and for natural numbers follow, in particular mathematical and other forms of

induction. Next is the construction of integers including some elementary number theory. The notions of finite and infinite sets, cardinality of counting techniques and combinatorics illustrate more techniques of proof. For more advanced readers, the text concludes with sets of rational numbers, the set of reals and the set of complex numbers. Topics, like Zorn's lemma and the axiom of choice are included. More challenging problems are marked with a star. All these materials are optional, depending on the instructor and the goals of the course.

About the cover :
Shapes, position, and patterns are featured topics in Kindergarten. Have students identify all of the shapes on the cover. Ask students to use words such as near / far to describe the position of the crab on the trees. Then have students describe the patterns they see on cover.
